Amazon Devices Relaunches Sustainability Messaging: Making It Easier for Customers to See What Sustainability Does for Them

By meeting shoppers where they already are and leading with the benefits they act on (devices built to last and lower running costs), Amazon Devices turns its certified sustainability data into a reason to choose Amazon, in service of The Climate Pledge.

SEATTLE — TechCrunch — October 2027 — Alongside its fall device lineup, Amazon today introduced Petiscos 2.0, a redesign of how sustainability shows up across the Amazon Devices shopping journey. The change reaches customers end to end: sustainability marketing that has been running since Earth Day, and a redesigned product detail page and fact sheet launching with today's new devices. Where sustainability information once sat in a dense, eight-page document buried below the fold (reached by fewer than 5% of shoppers), it now travels with the customer: in the marketing that first introduces a device, in the product images and specs shoppers already scan, and in a fact sheet rewritten to answer the question customers actually ask, "what does this do for me?" The certified carbon and life-cycle data that made Amazon the most credible source of device sustainability information remains, now given room to inform rather than to lead.

For years, Amazon published verified device sustainability data ahead of the market, and it earned trust. But the content wasn't reaching customers, and when it did, it opened with a figure in kilograms of carbon that most weren't sure how to read. Sixty-four percent of shoppers say sustainability matters when they buy electronics, yet far fewer could find what Amazon was doing about it. Petiscos 2.0 addresses that gap in three ways.

Meeting Customers Before They Reach the Page

The journey now starts earlier. Sustainability is moving into the marketing that brings customers to Amazon in the first place, beginning with Kindle and expanding brand by brand, in the channels customers already spend time in and, over time, on the shelves where they shop in person. "I'd been seeing ads on Facebook since April about how sustainable the new Kindles are," said Alan Fletcher, a teacher from Arkansas. "So when the new lineup was announced, I finally traded in my old one and upgraded to the Colorsoft Signature Edition. Knowing it's designed to last [8] years made it an easy call." The approach places sustainability in front of customers at the top of the shopping journey, rather than only at the bottom of a product page.

Sustainability, Where Customers Already Shop

On the detail page, sustainability is no longer a single destination customers have to hunt for. It runs throughout the page, in the places they already look. It appears above the fold, in the product images and highlight bullets shoppers see first. It sits inside the Tech Specs they already scan, with energy-efficiency and recycled-content attributes listed right alongside the specs they already compare, pulled automatically from the same system that powers the rest of the page. And it anchors a redesigned below-the-fold sustainability section: a cleaner, more visual experience that surfaces a device's strongest sustainability highlights at a glance and opens into the full fact sheet for anyone who wants to go deeper. A shopper comparing the newest Fire TV 4K stick sees, at a glance, that it's energy-efficient and made with recycled materials, the same message whether they're skimming images, reading specs, or scrolling the page. The result isn't just more visible sustainability information. It's a better detail page that represents Amazon's commitment to their customers and our planet.

A Fact Sheet That Speaks Human

For customers who want the full picture, the fact sheet is now a two-to-three page summary that opens with the benefits (how long the device is built to last, what it can save on energy, what it's made from) instead of a unit of measurement. Carbon footprint gets its own page, in plain language: what it is, how Amazon measures it, and why it matters. "I care about shopping more consciously, but I'm honestly still learning

what it all means," said Anna Morell, a senior at Arizona State University who recently shopped for a new Echo. "When I opened the fact sheet, there was a whole page dedicated to the carbon footprint, and I was able to learn what the number actually means and why Echo is working to decarbonize its products."

"Three years ago we made a deliberate bet that Amazon would be the most transparent source of device sustainability data, before customers were asking for it. They told us the transparency was right, but there was more of the story to tell," said Maiken Moeller-Hansen, Director of Devices and Services Sustainability at Amazon. "Petiscos 2.0 starts with what sustainability means for the customer and puts it where they already are. Every claim still traces back to the same verified data. We're not saying more — we're saying it in a way that's human."

The redesigned detail page and fact sheet launch with Amazon's fall lineup, targeting a worldwide rollout across all devices launching this fall that carry third-party-assured Life Cycle Assessments (LCAs). Sustainability marketing has been in market with Kindle since Earth Day 2027, with expansion to additional brands pending OP2 approval. Customers can find sustainability information for participating Amazon Devices on the product detail page.

Over time, Amazon Devices intends for sustainability to become a standard part of how customers choose electronics, as visible and as useful as battery life or screen size, across every brand, every marketplace, and every point where a customer decides what to buy.

Tenets (Unless you know better ones...)

The Petiscos 1.0 tenets (Verified, Simplified Disclosure, Transparent about Uncertainty, Variable, Human Off the Wheel) defined how we built the product and remain the production guardrails for what we publish. The 2.0 tenets define how we decide, listed in priority order so that when two apply to the same call, the higher one wins.

1. **Do no harm.** We would rather say nothing than add a claim that clutters the shopping journey, confuses the customer, or says more than the data supports.

Being seen is never worth losing trust, so when visibility conflicts with clarity or accuracy, clarity and accuracy win.

2. **Speak human.** We lead with what sustainability does for the customer (built to last, saves money), in words a shopper gets at a glance rather than language that needs a background in environmental science. When plain and comprehensive conflict, we cut for plain and let the dedicated pages carry the depth.
3. **Meet customers where they already are.** We add sustainability to the surfaces customers already use and the assets teams already build, like product images, marketing, and the product-page specs, instead of creating new destinations or fighting for net-new real estate. Riding an existing surface beats building our own, and discoverability beats depth.
4. **Scale is the default.** Anything we ship has to templatzize across programs and locales through the automation pipeline. If it only works as a one-off, it is a test, not a plan.
5. **Make partners want in.** Petiscos owns almost no surface of its own, so we earn placements by making each ask a win for the partner and absorbing the work ourselves, not by forcing a mandate. We will narrow or drop an ask that does not help the partner rather than push one that does not.

Frequently Asked Questions

Customer FAQs

FAQ1: Where will I see sustainability information?

You'll see it across a 360-degree campaign, in advertising on the web and on the product detail page itself. On the detail page, sustainability appears in the slate images, the above-the-fold bullet points, the Tech Specs, and a dedicated sustainability pack. The claim you meet in an ad is the one you find again on the page, reinforced at each step of the purchase. You do not have to go looking for it; it meets you where you already shop.

FAQ2: Which devices will feature these changes?

The programs leading this are Echo, Kindle, Alexa Tablets, and the Fire TV Product

Line. Ring, Blink, and eero follow the same approach under different ownership. Detail pages are not built the same way across programs, and each one caters a different customer experience, so this is not one template dropped across the store. We embed the approach into each team's go-to-market playbook, so the teams that own those pages steer the changes for their own customers.

FAQ3: Is it available in my country and language?

Today the fact sheet publishes in the United States, in English and Spanish. Beginning with this fall's launch it expands to 14 Amazon marketplaces and 32 locales, appearing in each market's local language rather than one translated version. The new fact sheets comply with country-level regulations, including the EU's green-claims rules (EGCT), Canada's Competition Act amendments (Bill C-59), and the UK Green Claims Code. The full list of covered countries is in Appendix [X].

FAQ4: What does sustainability do for me?

Sustainability claims like durability and energy savings benefit the customer directly, not only the planet, and customers respond: 37% reported higher purchase intent after seeing sustainability framed as a benefit (AYTM #765923, n=400). A device built to last means more use from what you buy and fewer replacements, and an energy-efficient one uses less power in everyday use. Recycled materials are the proof a claim is real rather than the headline, delivering the same performance from lower-impact inputs. We lead with the benefits customers act on, and keep testing new ones that show sustainability works for them, not just for the planet.

FAQ5: Why does the carbon footprint get its own page?

Our May 2026 survey (n=400) signaled that the carbon number was not landing on its own: 18% of customers said they did not know what 203 kg CO₂e meant, and only 43% found it helpful (AYTM #765923). A single figure shown without context leaves most customers unable to use it. So the carbon footprint gets its own page, with room to explain what 203 kg means, how it compares, how Amazon measures it, and why it matters. The dedicated space serves both audiences: it educates the customer still learning what the number means, while keeping the full data intact for the customer who already understands it.

Internal FAQs

FAQ6: What is the North Star for Petiscos 2.0?

Petiscos translates certified sustainability data into personal benefits, giving customers more reason to choose Amazon Devices. This moves the mandate from the 2023 job, carbon-footprint transparency, to the 2027 job, a sustainability communication platform, while keeping the third-party-assured data that sets Amazon's claims apart from marketing.

FAQ7: What is the big bet, and why lead with offline and upper-funnel marketing?

The big bet is to move sustainability into the marketing customers see before they reach a product page, starting with Kindle and expanding brand by brand. 42% of eco-conscious customers do not own an Amazon device, 66% become more likely to purchase once they are aware of Amazon's sustainability work, and no electronics brand yet owns the sustainability position (DSS Customer Sentiment, n=1,500). But 49% of customers do not know Amazon has any sustainability initiative, so the work stays invisible at the bottom of a detail page. Marketing is where Amazon can close that awareness gap, tell a specific and verified story, and reach eco-conscious shoppers before they choose a competitor.

FAQ8: Which sustainability claims do we lead with, and why?

We rank claims by how much they move purchase, not by how green they sound. DSS conjoint research puts durability first: longer product lifespan drives 56.5% of purchase decisions, and an extended-lifespan guarantee, replaceable batteries, and easy-to-repair design each shift purchase intent 82 to 85%. Energy efficiency follows, influencing 30.9% of decisions at roughly 83% intent impact, with trade-in adding 74%. Recycled materials rank third: customers say they value them (63% intent impact) but the claim shows near-zero conjoint utility, so we carry it as verified proof rather than a headline.

FAQ9: What does the enhanced detail-page experience mean?

The enhanced experience puts sustainability in the detail-page surfaces customers already see: the slate images, the above-the-fold bullets, the Tech Specs, and a redesigned sustainability pack below the fold. It has to move up, because today fewer than 5% of shoppers reach the section that holds the sustainability ESC card and its link to the fact sheet, and only 32% would seek the information out (AYTM #765923,

n=400). So the claims that move purchase lead the highest-traffic surfaces, with built to last and energy efficiency in the slate images and bullets, while the Tech Specs carry the verifiable attributes, energy-efficiency ratings and recycled content, pulled automatically from the same system that powers the page. A shopper then meets the same message whether they skim the images, read the specs, or scroll the page.

FAQ10: How do we scale this, and what does streamlining fact-sheet creation buy us?

Petiscos scales because everything it ships templativizes through the automation pipeline, built for 14 marketplaces and 32 locales with third-party-assured data on every sheet, rather than working as a one-off. The pipeline pulls data directly from Galvanize instead of the manual gathering across teams the process requires today, which removes hand-offs and error and recovers roughly 600 hours a year (Petiscos Automation BRD). Image production is the current unlock, moving the non-screened product imagery from a custom set per locale toward a single hero shot so a sheet scales internationally without rebuilding artwork market by market. The quality gate rides the same pipeline, so every published claim traces to third-party-assured data no matter how many sheets ship.

FAQ11: How does Petiscos create a flywheel?

Petiscos creates a loop. Better placement and plainer language raise how many customers see and act on a claim, and that response tells us which claims move customers, so we feed the winners into marketing and the detail page. When a claim measurably moves purchase, it gives a product team a commercial case to fund the underlying decarbonization, which generates new claims to communicate. New claims come from customer research and Galvanize data validated by DSS, Legal, and PR, replacing the manual ad-hoc deep dives the team relies on today (Petiscos Automation BRD).

FAQ12: What's in it for partner teams?

Petiscos owns almost no surface of its own, so every placement is a partner team's decision. We make each ask a win for that team and absorb the work: sustainability attributes are integrated into DCS, the tool that already populates detail-page specs, so they pull through to the page without new work from the partner, the fact sheet is produced by our pipeline, and the claim is pre-validated by Legal and PR. For the

partner, that is a differentiated, verified story on a dimension where customers do not yet perceive any electronics brand as leading (DSS Customer Sentiment, n=1,500). When a priority surface declines, we adjust the ask rather than mandate, and escalate through GTM planning only where the placement is material to the launch.

FAQ13: Are we walking back transparency by changing how carbon shows up?

No. Every claim on the redesigned pages traces to the same third-party-assured Life Cycle Assessment behind Petiscos 1.0, and none of the carbon or life-cycle data is removed. What changes is placement and framing: benefits lead, and the carbon footprint moves to a dedicated page that explains the number instead of opening with it. Leading with a figure only 43% of customers found helpful, and 18% could not interpret, spends attention without informing the customer (AYTM #765923, n=400). We say the same things, backed by the same data, in words a customer can use.

FAQ14: What is the biggest risk, and the dreaded headline?

The dreaded headline is "Amazon buries its carbon numbers," or a regulator challenging a claim as greenwashing. We manage it by removing no data, keeping every claim traceable to third-party-assured LCAs, and routing claims through Legal and PR before publish. Most moves are reversible, since placement, framing, and marketing can be tuned or rolled back. The two decisions closest to one-way doors are retiring the CARE claims-generation build and moving carbon to a dedicated page, and both are defensible on the customer data and remain adjustable if the evidence changes.

FAQ15: How will we measure success?

Success is measured on awareness and perception first, then purchase behavior. The candidate primary metric is the lift in customers aware of Amazon's sustainability efforts, tracked through the DSS Customer Sentiment survey on a set cadence, because awareness is the lever the data points to: 49% are unaware today, and awareness moves 62% to view Devices more favorably and 52% to be more likely to buy (DSS Customer Sentiment, n=1,500). Secondary metrics are purchase-intent lift from the fact-sheet survey (37%) and engagement on the redesigned detail-page surfaces. We will not judge success on sales lift alone, because sustainability messaging cannot be cleanly isolated from price, reviews, and launch timing. [Metric

targets and the awareness-tracking method to be finalized in a measurement working session.]

FAQ16: Why expand internationally, and how does EU regulation factor?

The reason to move now is regulatory readiness. The EU is finalizing the Green Claims Directive, which raises the substantiation bar for environmental claims on product pages, and a brand without a compliant, scalable way to publish may have to pull its sustainability claims to stay within the rules. Petiscos 2.0 keeps Amazon publishing: the same pipeline that scales the fact sheet evaluates each claim for compliance and adapts wording market by market, so Amazon keeps making verified claims where less-prepared brands cannot. Demand supports the move, with European customers showing high stated concern for sustainability, though the EU share of Amazon Devices and a current EU-customer demand figure are still being sourced [TK].

FAQ17: What is the rollout sequence, and who owns it?

The rollout is sequenced. Sustainability marketing is in market with Kindle now (since Earth Day 2027), and the redesigned detail page and fact sheet launch with the fall device lineup. International expansion is targeted for the same fall launch but gates on each marketplace reaching compliance and localization readiness, so markets go live as they qualify. The single-threaded owner is the DSS PMT who owns Petiscos (Petiscos Automation BRD), accountable for the pipeline, the claims, and the partner asks, and expansion to brands beyond Kindle is pending OP2 approval.

FAQ18: What did we explore and deprioritize?

We set four things aside. First, a sustainability storefront, because the 286M-session detail-page analysis shows customers do not travel to sustainability, they encounter it in the buying path, and we will not take on the multi-year browse-traffic problem. Second, email marketing campaigns, for the same discoverability reason and to protect focus. Third, a net-new sustainability-only section as its own destination, which cuts against putting claims on surfaces customers already use. Fourth, a large CARE-style build to manufacture avoided-emissions claims across the portfolio, which is not moving forward, because we lead with claims already assured and add new ones through research and Galvanize data as they qualify.
